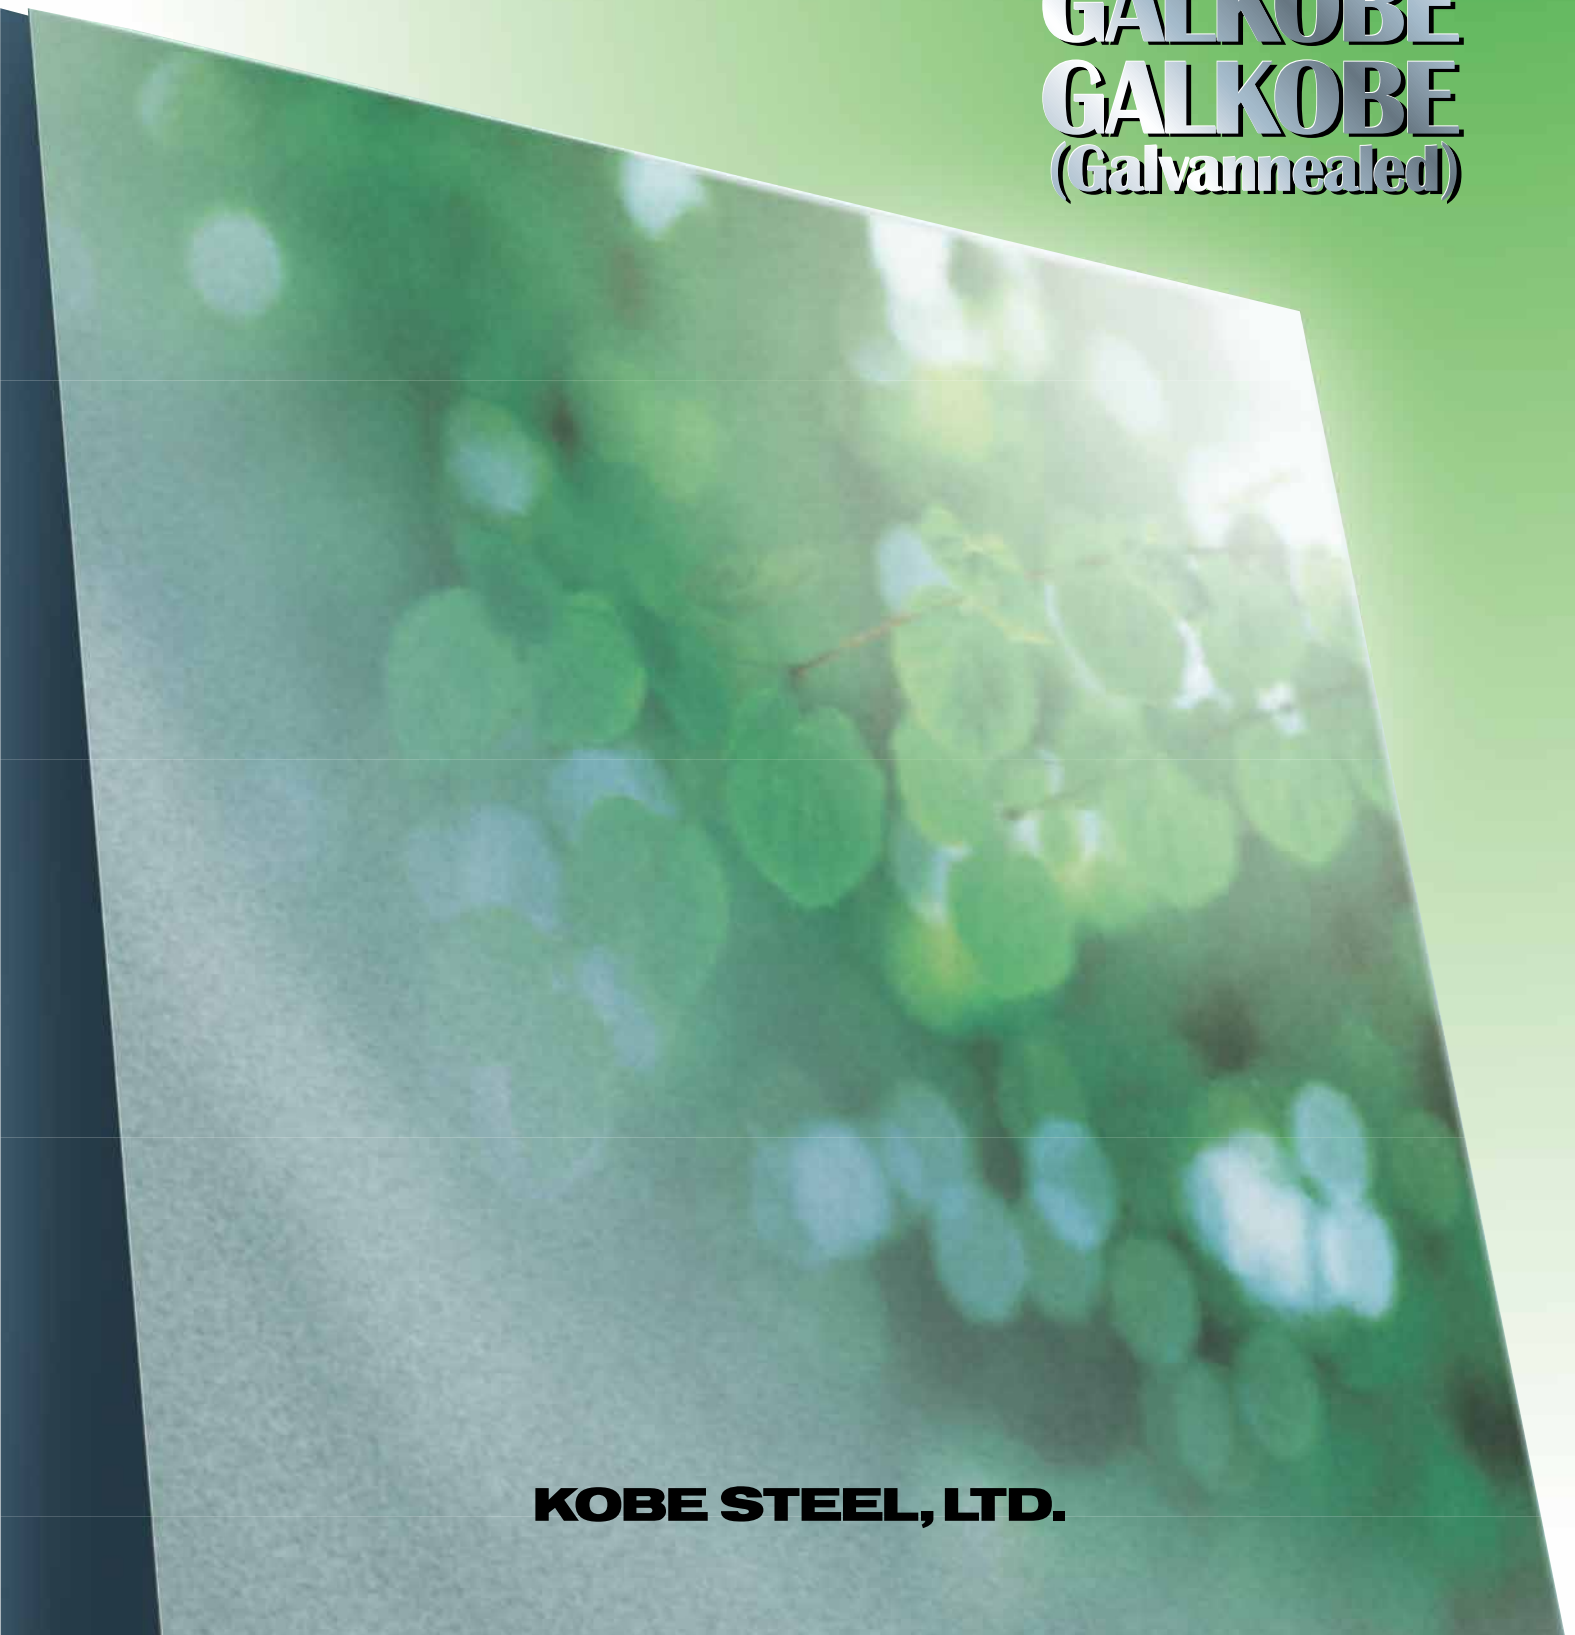
Chromate-free, environment-friendly

GALVANIZED STEEL SHEETS

ZINKOBELLA
GALKOBE
GALKOBE
(Galvannealed)



KOBE STEEL, LTD.

With enhanced needs of higher quality of products, labor saving in manufacturing processes and pollution prevention, galvanized steel sheets have been extensively used for automobiles, household appliances, and construction materials. The demand has been increasingly expanded along with the improvement of peoples' living and culture.

Kobe Steel has devoted itself to improve the quality of galvanized steel sheets, and develop proprietary products to meet the customer needs.

This catalog covers various types of galvanized steel sheets manufactured by Kobe Steel.

We hope this helps you to select appropriate galvanized steel sheets for your particular application.

Contents

Features

Environment-friendly, complete chromate-free

Kobe Steel commercialized the world first chromate-free galvanized steel sheet in 1998, and today all the galvanized steel sheets are chromate-free. The chromate-free steel sheet is environment-friendly, and complies with various regulations, such as RoHS and ELV, which can be used extensively without problems.

Excellent corrosion resistance

The steel sheet is covered with a uniform zinc-plated layer by controlling the amount of zinc coating. The zinc-plated layer itself is chemically treated, which ensures excellent corrosion resistance.

Outstanding appearance and workability

The galvanized surface is smooth and uniform, thanks to advanced production facilities and a sophisticated quality control system that guarantee excellent workability, paintability, and weldability.

Wide product range

We supply different grades of galvanized steel sheet for various uses, including automobiles, electrical appliances, and construction materials. The quality of the base steel, the amount and composition of the zinc coating, and the subsequent chemical conversion coatings are all specifically designed to provide optimum performance for each application.

Timely technical services

For use of galvanized steel sheets, please consult our sales or technical service section. Kobe Steel provides timely customer-oriented technical services, based on plenty of experience.

Cautions

The technical information contained in this catalog is to illustrate general characteristics and/or performances, but not to guarantee anything.
The technical information contained in this catalog may not be applicable depending on the purpose, environment, or conditions of use.
This catalog is subject to change without notice. For updated information, please consult our relevant section.

Galvanized steel sheet products

Kobe Steel manufactures and markets the following galvanized steel sheet products for a wide variety of industrial applications.

Product list

Type of coating	Product name	Zinc coating mass		Chemical conversion coating	Features
Electrogalvanized steel sheet	**ZINKOBELLA**	30g/m² or less (one side) Note 1)	JIS classification: ES-E24 Note 1	Phosphate treatment…**GREEN COTE GX-GP** Anti-fingerprint treatment…**GREEN COTE GX-K2** Anti-fingerprint treatment…**GREEN COTE GX-KS** Lubricant treatment…**GREEN COTE GX-J2** * All are chromate-free treatment.	•Steel sheet featuring excellent workability is uniformly galvanized to produce a smooth, attractive surface finish. •A chemical conversion coating applied after galvanizing provides added protection against corrosion and improves paintability. •Because the galvanized coating is thin, the finished steel sheet is easily welded. •Chemical conversion coatings are also applied for high corrosion resistance, and good anti-fingerprint and lubrication characteristics. •Conforms to JIS G 3313 and equivalent standards.
Hot-dip galvanized steel sheet	**GALKOBE**	30g/m² - 150g/m² (one side)	JIS classification: Z06-Z27 Note 2	Chromate-free Treatment **GREEN COTE GX-GC**	•Because the galvanized coating is thick, the finished steel sheet is particularly resistant to corrosion. •Has an attractive metallic luster. •Zero-minimized spangle only. •Conforms to JIS G 3302 and equivalent standards.
	GALKOBE (Galvannealed)	30g/m² - 90g/m² (one side)	JIS classification: F04-F12	Chromate-free Treatment **GREEN COTE GX-GC**	•Heat-treated to produce a zinc-iron alloy surface for excellent paintability, weldability, and particularly outstanding corrosion resistance after painting. •Conforms to JIS G 3302 and equivalent standards.

G90, G60 and A60 are approved by UL (Underwriters Laboratories, Inc.) of the U.S.
Note 1: For electrogalvanized steel sheets over 30 g/m² on one side, or JIS E24, please consult us.
Note 2: For hot-dip galvanized steel sheets over JIS Z27, please consult us.

Galvanized steel sheet products

Chemical conversion coating

Type of coating	Product name	Type of coating	Symbol	Coating structure	Features: Corrosion resistance	Pain ability	Anti-finger print properties	Lubricant properties	Weldability	Electric conductivity
Electrogalvanized steel sheet	**ZINKOBELLA**	Phosphate treatment	**GX-GP**			◎				
		Anti-fingerprint treatment	**GX-K2**		◎	○	◎	○	○	○
			GX-KS		○	○	◎	○	○	◎
		Lubricant treatment	**GX-J2**		◎	○	◎	◎		
Hot-dip galvanized steel sheet	**GALKOBE**	Chromate-free treatment	**GX-GC**		○	○	◎		○	○
	GALKOBE (Galvannealed)	Chromate-free treatment	**GX-GC**		○	◎	○		○	◎

Note 1: Electorgalvanized and hot-dip galvanized steel sheets with no chemical conversion coatings are oiled (symbol M), as a standard.
Note 2: Paint ability depends on the type of paint used and the chemical treatment applied before painting. A paint test should be conducted prior to painting.

Applications and optimum grades

Available in different grades with a variety of specialized coatings, Kobe Steel's galvanized steel sheets offer customized characteristics for an impressive range of applications.
When deciding which type of steel sheet is best for you, please keep the following three points in mind.

Three key points for selection

Will it be used indoors or outdoors?
Will it be painted or unpainted?
What characteristics - corrosion resistance, workability, weldability, etc. - are needed?

Application		Electrogalvanized steel sheet	Hot-dip galvanized	
		ZINKOBELLA	**GALKOBE**	**GALKOBE (Galvannealed)**
Automobiles	Exterior panels		○	○
	Interior panels		○	○

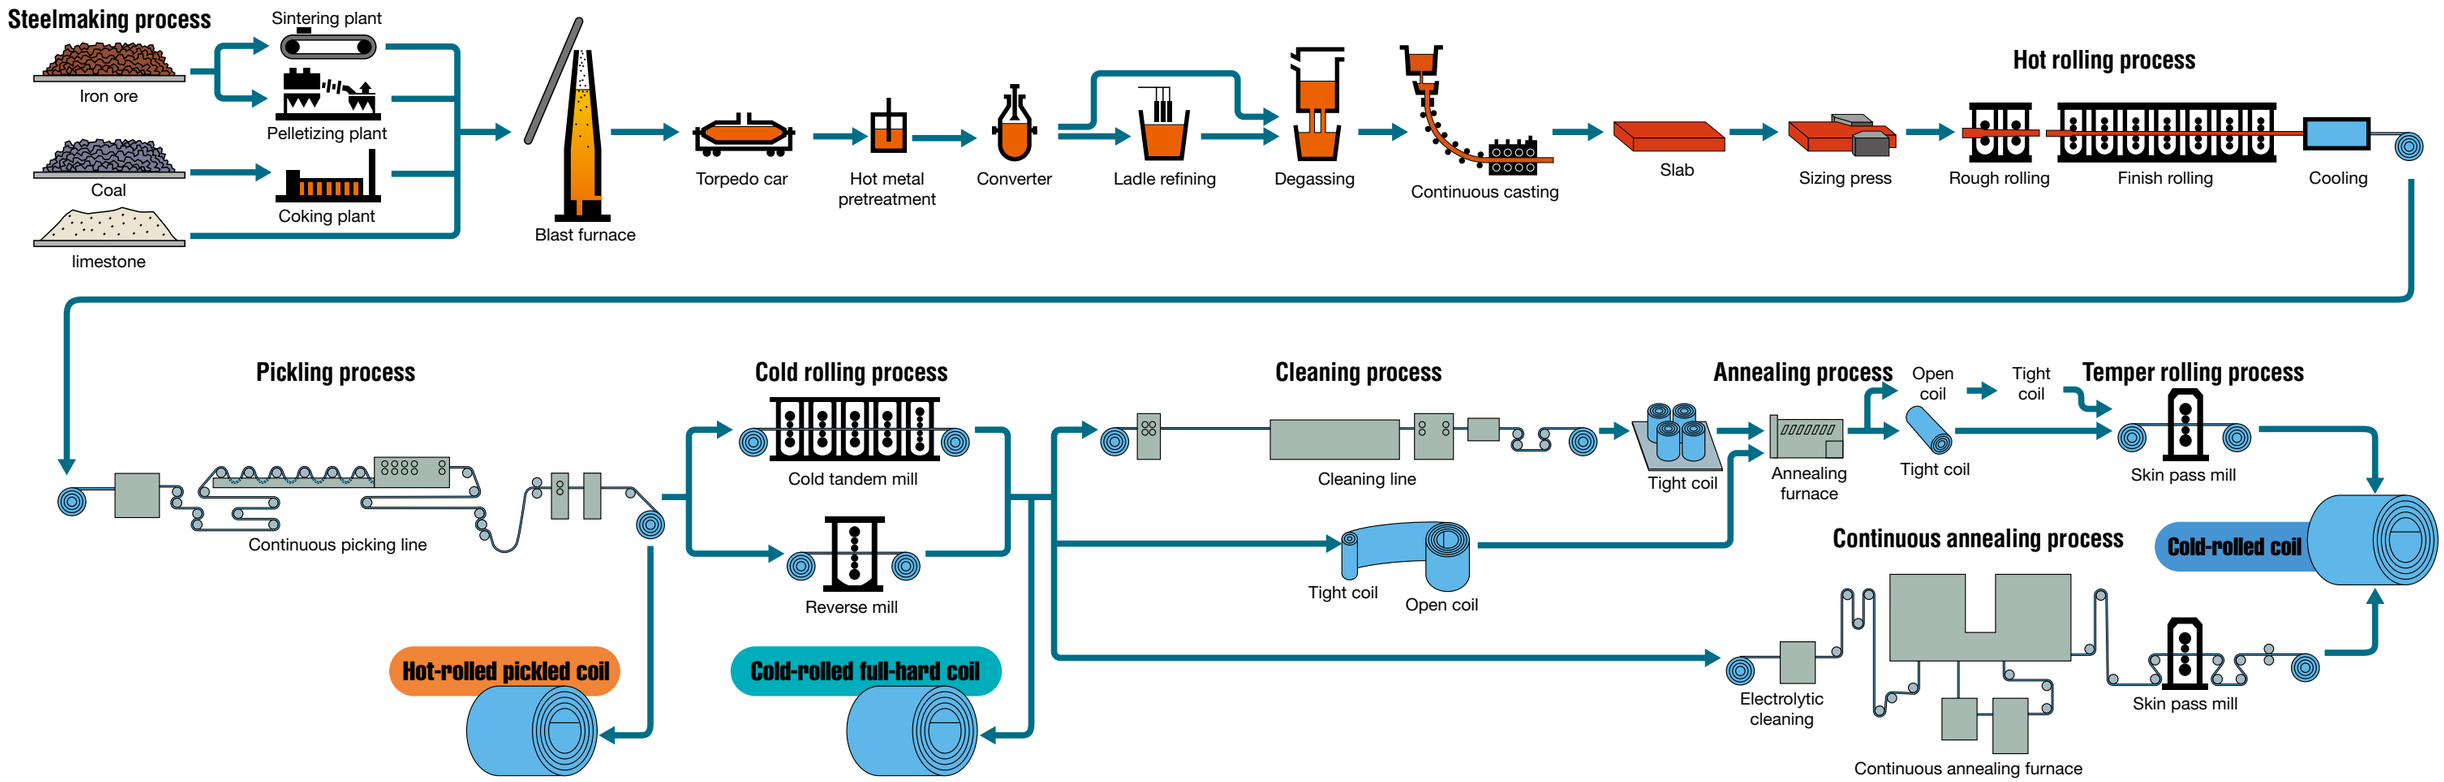
Manufacturing processes



Blast furnace

Converter

Hot finish rolling mill

Cold tandem mill (cold tandem mill)

Continuous annealing furnace

Galvanizing process

Electrogalvanizing line

Welding process

The end of a steel sheet (either hot- or cold-rolled) is sheared and welded to the preceding coil to form one continuous coil.

Straightening process

A high-performance tension leveler is used to straighten the strip, resulting in excellent flatness.

Cleaning process

The strip is dipped in an alkali bath and brushed for preliminary degreasing, and then undergoes alkaline electrolytic degreasing. This removes impurities on the material surface that could harm the zinc coating. The strip is then dipped in a acidic bath to activate the surface.

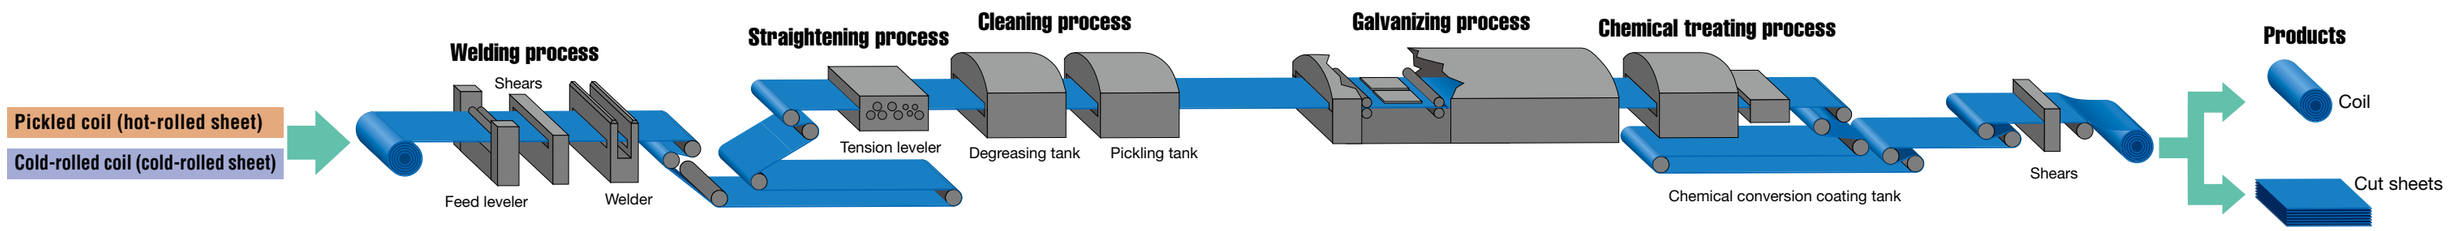
Galvanizing process

The cleaned strip enters the coating tank, where plating is carried out under strict bath control.

Chemical treating process

The zinc-coated strip is given various chemical treatments according to intended use, including phosphate treatment for excellent paintability, and chromate-free special treatment for good corrosion resistance.

Electrogalvanizing line



Hot-dip galvanizing line

Welding process

The end of a steel sheet (either hot- or cold-rolled) is sheared and welded to the preceding coil to form one continuous coil.

Galvanizing process

After annealing, the strip remains in a reduction atmosphere and is dipped directly into a bath of molted zinc. The amount of zinc coating is controlled by means of the gas wiping method. Depending on the intended application, alloying treatment may be applied to the strip.

Straightening process

Through the combined use of a high-performance tension leveler and skin pass mill, a product with excellent flatness and a smooth, attractive surface finish are obtained.

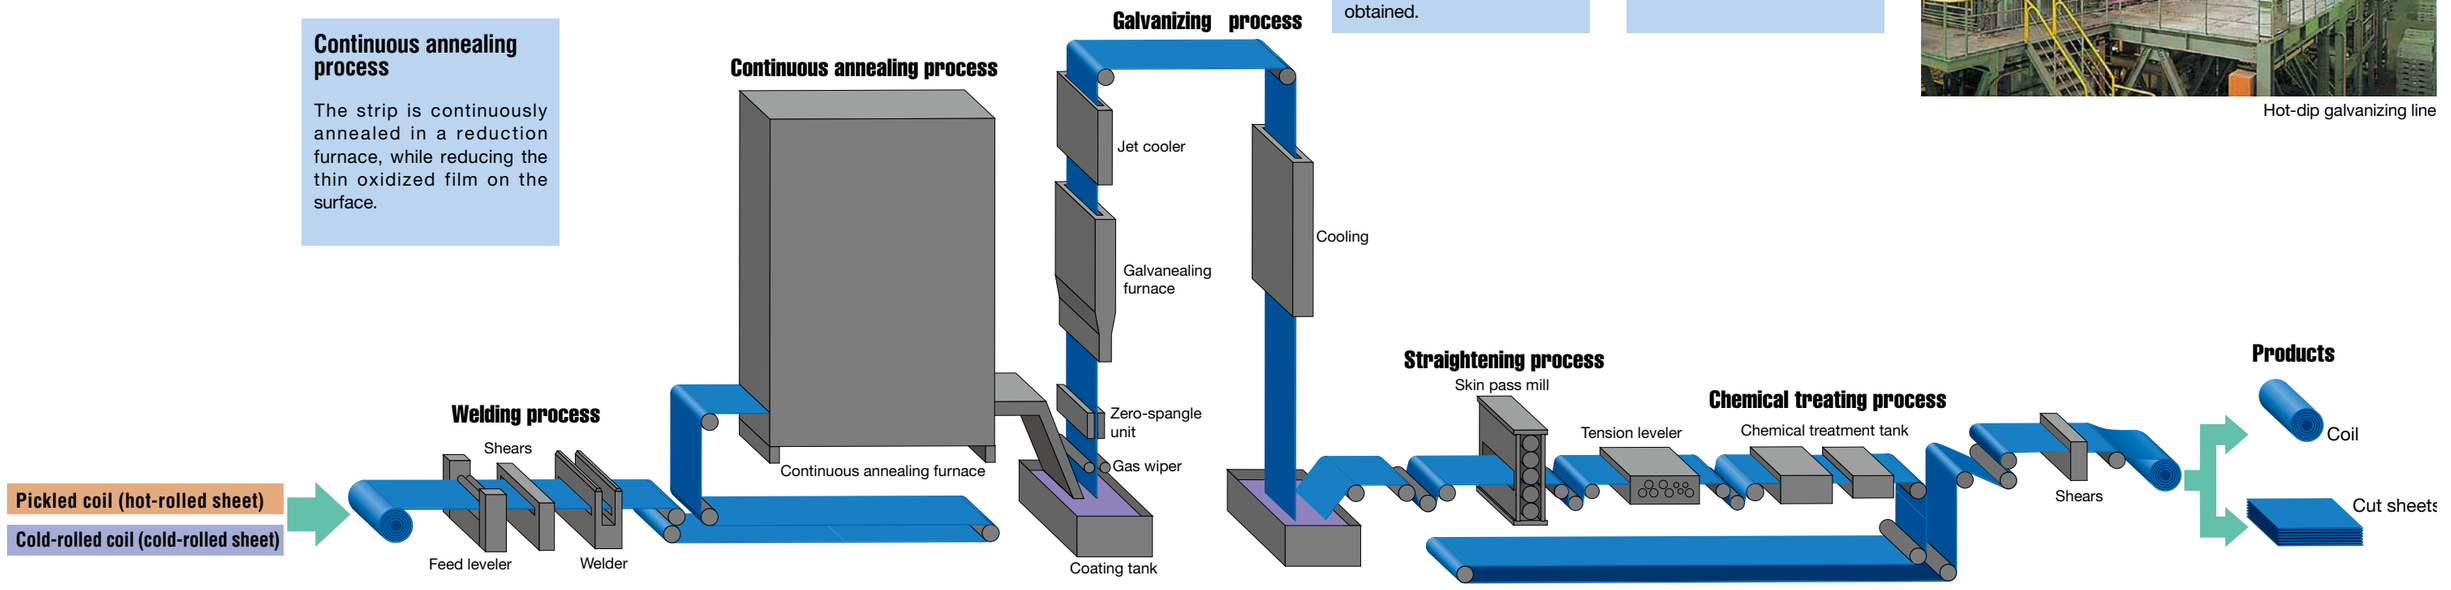
Chemical treating process

A chromate-free special treatment is then applied to the zinc-coated strip, in accordance with the intended use.

Continuous annealing process

The strip is continuously annealed in a reduction furnace, while reducing the thin oxidized film on the surface.

Hot-dip galvanizing line



Product characteristics

Excellent corrosion resistance

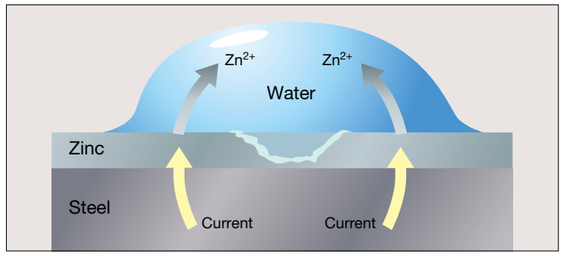
The uniform zinc coating protects the base steel from corrosion, and can withstand long-term use without generating rust.

- Zinc ionizes more easily than steel, and therefore acts as a sacrificial anode to protect the base steel from corrosion. This is called galvanic action. Even if the base steel is exposed, as for example at the sheet end or through a surface damage, the zinc coating surrounding the exposed part continues to protect the steel from rust.
- When zinc reacts to moisture in the air, it generates white rust. To prevent this, chromate-free and other special treatments are applied to the galvanized sheet.
- The time to take for red rust to develop on the base steel is proportional to the amount of zinc coating.

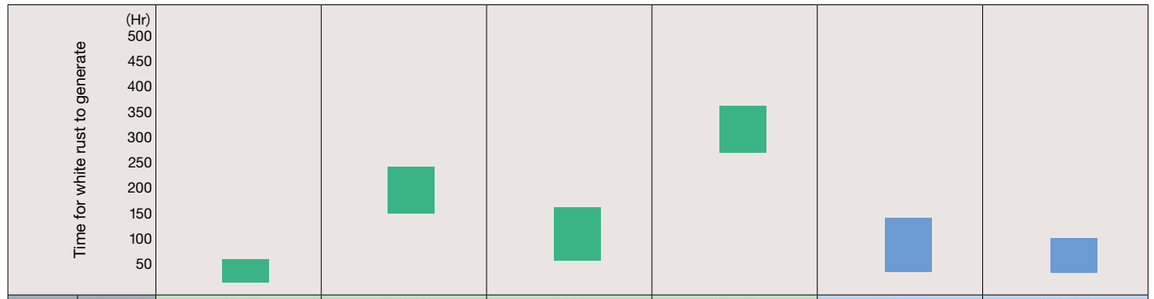
Estimated zinc life under various environmental conditions (years)

	Rural	Seaside	Urban	Industrial
610 (Both sides) (g/m²)	50	35	25	15
381 (Both sides)	35	25	17	9
305 (Both sides)	25	15	10	7
90 (One side)	10	7	4	3
60 (One side)	7	5	3	2

Galvanic action

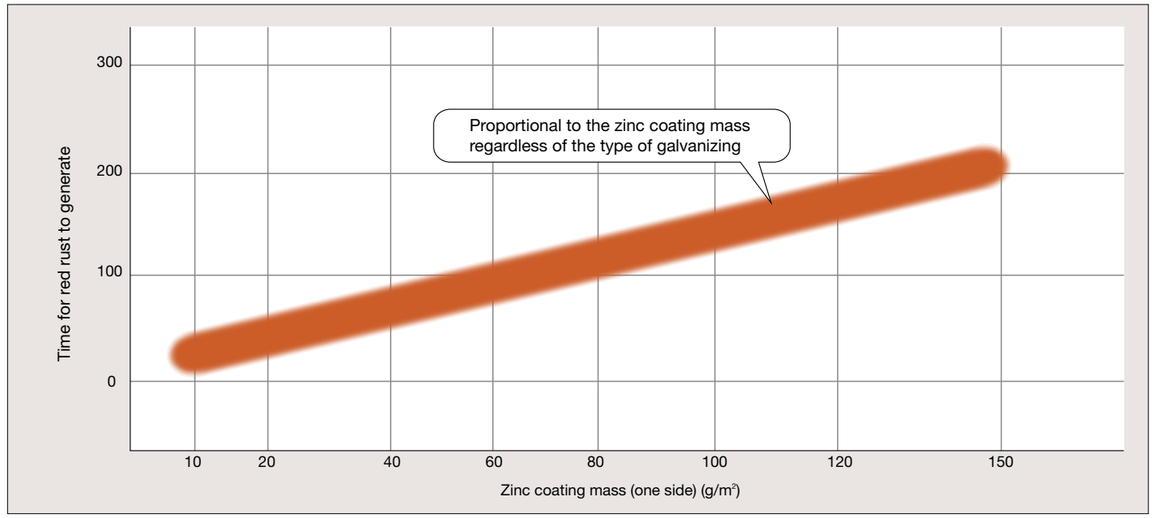


Relationship between surface treatments and white rust (flat sheet, saltwater spray)



Coating	Symbol	GX-GP	GX-K2	GX-KS	GX-J2	GX-GC	GX-GC
	Type	Phosphate treatment	Anti-fingerprint treatment		Lubricant treatment	Chromate-free treatment	Chromate-free treatment
Product name		ZINKOBELLA				GALKOBE	GALKOBE (Galvannealed)
Type of coating		Electrogalvanized steel sheet				Hot-dip galvanized	

Relationship between zinc coating mass and red rust (flat sheet, saltwater spray)

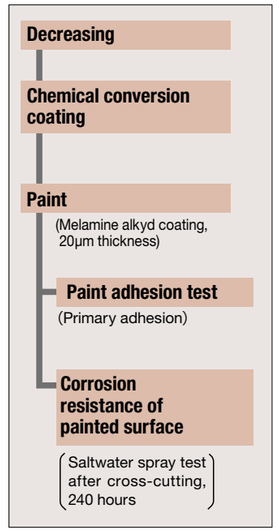


Outstanding paintability

Excellent paintability is assured through appropriate pre-paint treatment.

Galvanized steel sheet is most often painted before use.
To ensure proper paint adhesion, the surface must be thoroughly degreased and an appropriate chemical treatment shall be applied.
The same fine, uniform chemical coatings as for cold-rolled sheet can be applied to all varieties of galvanized sheet.

Product type	Product name	Paint adhesion	Corrosion resistance of painted surface (external rust)
Electrogalvanized steel sheet	**ZINKOBELLA**	◎	○
Hot-dip galvanized steel sheet	**GALKOBE**	◎	○
	GALKOBE (Galvannealed)	◎	◎
Cold-rolled steel sheet		◎	×



To reduce costs and environmental hazards, Kobe Steel also supplies galvanized steel sheet that has been chemical treated at the factory so that there is no need to prime the material before painting. In general, ZINKOBELLA (GX-GP treatment) and GALKOBE (Galvannealed) are most suitable for painting applications. For best results, choose a paint that is compatible with the chemical treatment applied.

ZINKOBELLA
GX-GP treatment

The phosphate film generated on the sheet surface assures outstanding paint adhesion, with an extremely smooth and attractive paint finish that only electrogalvanizing can provide.

GALKOBE
(Galvannealed)

The alloying treatment diffuses iron particles in the coated surface to produce fine irregularities that ensure excellent paint adhesion.

Superior workability

Our carefully selected galvanized steel sheets manufactured under strict quality control all feature excellent workability.

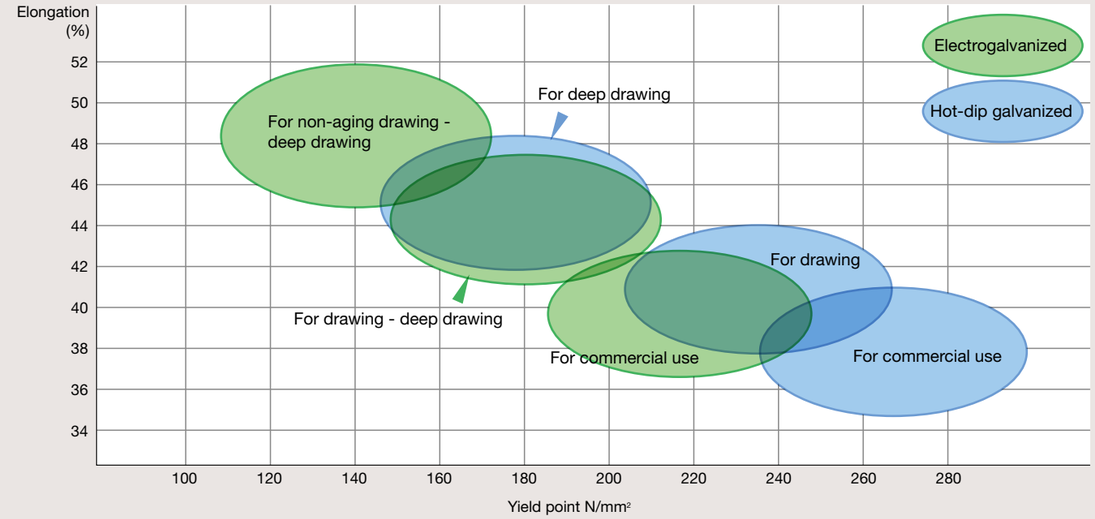
When processing galvanized steel sheet, consideration must be given to the workability of both the base sheet and the coating. Since electrogalvanizing and hot-dip galvanizing are different processes, they result in different kinds of workability.

Deep-drawn GALKOBE

Workability

Type of coating	Product name	Workability of base sheet	Workability of zinc-plated layer	Overall evaluation
Electrogalvanized steel sheet	**ZINKOBELLA**	The galvanizing process does not affect mechanical properties. In the electro-galvanizing process, steel sheets are not heat-affected; therefore, they maintain the same workability as that of hot-rolled and cold-rolled steel sheets.	While hot-dip galvanized steel sheets are composed of zinc and iron-zinc alloy coating, electrogalvanized steel sheets have pure zinc layer with excellent ductility, but no brittle iron-zinc alloy layer, which may cause peeling off with the former sheets.	Has the same workability as hot- and cold-rolled sheets.
Hot-dip galvanized steel sheet	**GALKOBE**	For hot-dip galvanized steel sheets, mechanical properties are given during a short time of the continuous annealing stage in the galvanizing process. However, they are heat-affected during the subsequent galvanizing stage; therefore, they lose some of their normal workability compared to the normal hot-rolled and cold-rolled steel sheets. By using higher-grade materials, products with good workability are available.	The surface layer is pure zinc, with excellent ductility. Between the base metal and the surface layer are thin alloyed-layers of iron and zinc, but their structure and thickness are strictly regulated so that the zinc-plated layer will not peel off.	Standard products are lightly less workable than hot- and cold-rolled sheets, but products with good workability are also manufactured by using higher-grade materials.
	GALKOBE (Galvannealed)		The surface layer consists of high-grade iron and zinc alloy, making it harder and less ductile than pure zinc. When subjected to server processing, tiny cracks can form in the alloyed layer, or the alloyed layer is powdered (this phenomenon is called powdering).	In terms of powdering, alloyed products are less workable than non-alloyed products. However, this rarely causes a problem in actual applications.

Image of mechanical properties (Thickness 0.8mm)



Assured weldability

By maintaining proper welding conditions, you can achieve welding results comparable to those obtained with hot- and cold-rolled sheets.

When electric resistance welding, conditions for galvanized steel sheet differ somewhat from those for hot- and cold-rolled sheet because zinc is a soft metal with a low melting point. Also, when zinc adheres to the electrode, it forms a copper zinc alloy that impairs continuous welding efficiency. The higher the zinc coating, the stronger this tendency becomes. Because GALKOBE features harder surface layer with higher melting points, its welding conditions and continuous welding efficiency approach those of hot- and cold-rolled sheets.

Please keep the following points in mind when spot welding and seam welding galvanized steel sheets.

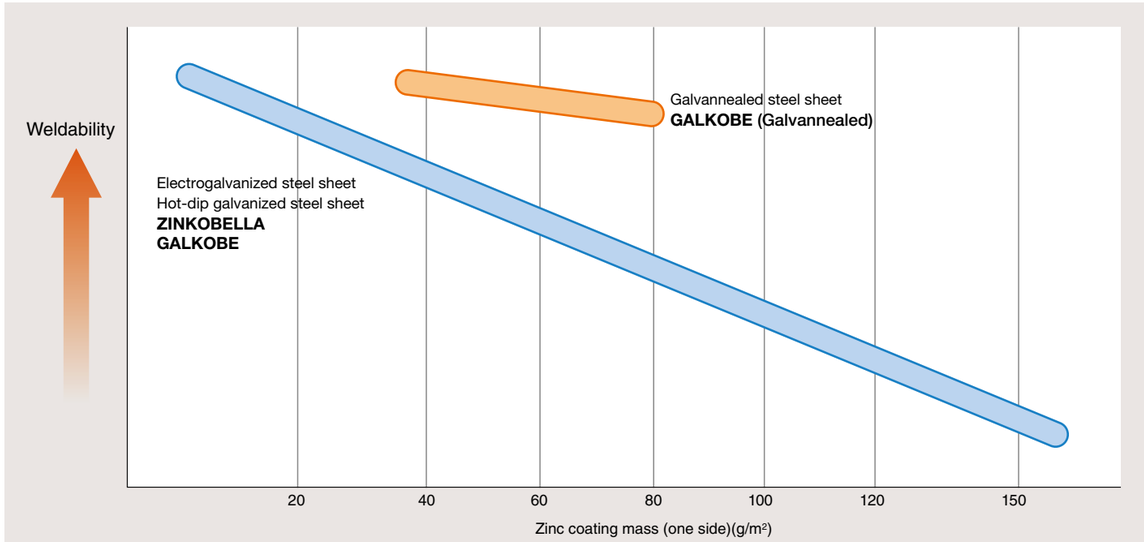
Spot welding

- Set the welding current 10-30% higher than usual.
- Extend the weld time 10% longer than usual.
- A Cr-Cu alloy electrode with a JIS-C type truncated cone tip is recommended.
- Clean the electrode often, and make sure you have adequate water-cooling.

Seam welding

- Set the welding current high.
- Control air bubbles and internal defects by increasing the welding pressure.
- Interrupted current is recommended. In addition, a high ratio of intervals with current to intervals without current should be maintained for best results in the welded sections.

Relationship between zinc coating mass and weldability



Specification and range of available products

Cold-rolled sheet

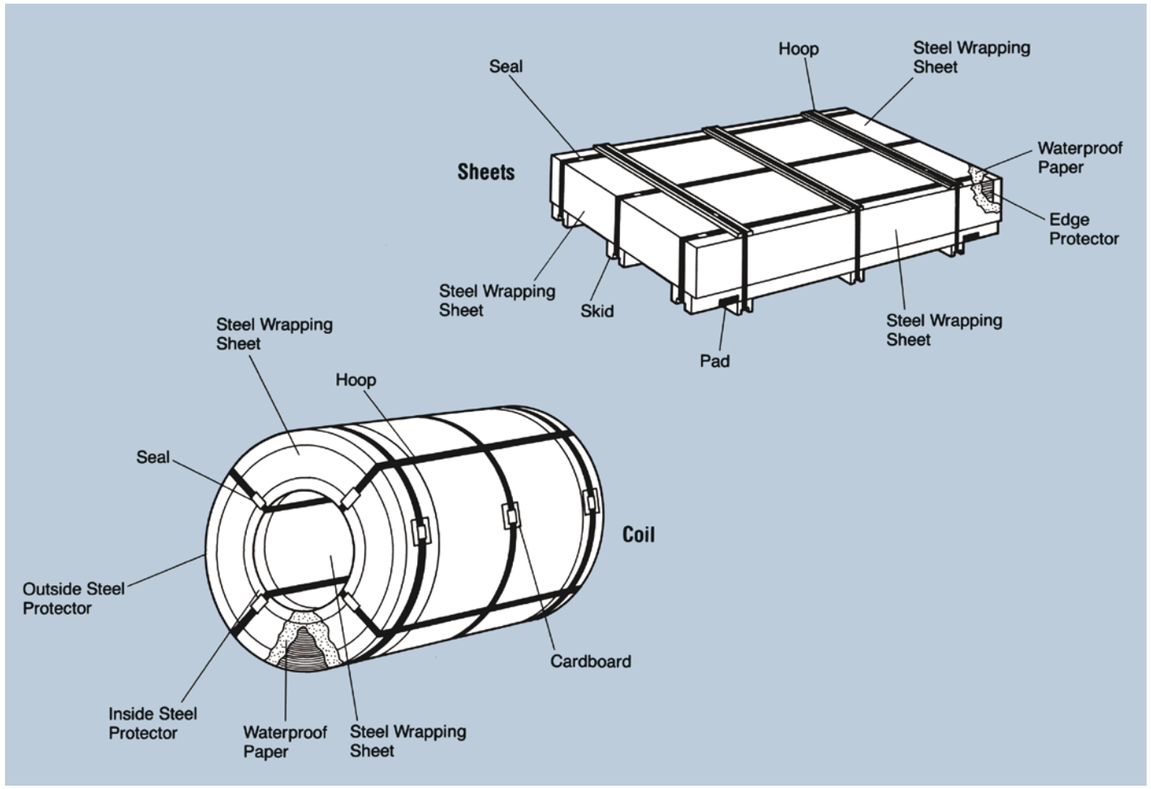
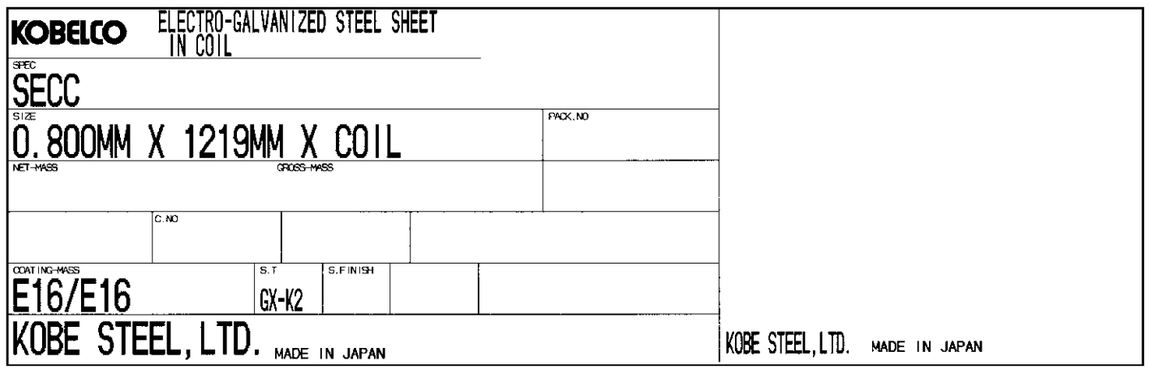
Packaging and Identification

Packaging



Identification

Every package has an identification sticker printed with specifications, package number, dimensions, mass, number of sheets (when applicable), material grade, customer name, and other pertinent information.



Notes for use

To get the best performance from your Kobe Steel's galvanized steel sheet, please observe the following precautions for use.

Storage

Under normal transport, storage, and processing conditions, there is little danger of rust. However, if the sheets are stored for long periods of time in a place exposed to rainwater or dew, or in high humidity, white rust can develop. To avoid this, choose a dry, clean place for storage.
If the packing paper is torn, cover the torn area immediately.

Handling

The zinc coatings are softer and more easily damaged than the steel sheet base. Although surface scratches will not immediately give rise to red rust, they mar the product's attractiveness. In addition, white rust can develop if the chemical treatment coating is damaged. The sheets should therefore be handled with reasonable care.
If the sheets are stained with press oil, machine oil, sweat, or fingerprints, they cannot deliver full performance. They should therefore be thoroughly cleaned before use.

Processing

Galvanized steel sheet is covered with a soft zinc surface. When rolling or pressing it, care must be taken to damage the sheet surface. Make sure that equipment and molds are clean and free of all foreign materials before processing.
The nominal thickness of galvanized steel sheet is the same as the thickness of the base sheet. When the zinc coating is thick, allowance must be made for the extra thickness when setting a mold clearance.

Welding

Appropriate welding conditions should be selected according to the zinc coating mass and chemical treatment applied.
Electrodes for resistance welding use cupper alloy, which easily alloys with zinc. It may result in stain and/or deformation of the electrode chip; therefore, it is necessary to dress or replace the chip during operation.

Degreasing and painting

Painting with insufficient degreasing may result in a painting defect; therefore, sufficient degreasing is critical. Do not use strong alkali degreasing agent, since it may significantly damage the surface.
Galvanized steel sheets with chemical treatment provide excellent paint adhesion; however, choose a paint that is compatible with the chemical treatment applied. Otherwise, it may result in poor paint adhesion.
